~ Property Management ~

## MANAGE YOUR WATER CONSUMPTION

As the effects of climate change are becoming clearer, it is important to monitor our water usage for the irrigation of our gardens and the topping-up of our swimming pools. By doing this we can see how we could better control water consumption in relation to water rates, especially for consumption of over 201 tons where the rate is €5.00 + VAT.

### Why not consider a Water Meter for your garden?

By using a Smart Water System, the grounds for customer contention are considerably reduced, as are water losses due to the rapid detection of leaks and over

consumption, or even with the installation of a separate water meter for the irrigation of gardens and topping-up of the pool.

A Smart Water System with web-based software, activated and controlled from anywhere in the world, can be done using your smart device or web browser. Predictive watering adjusts schedules based on temperature forecast, rainfall probability, wind and humidity - this will provide maximum water savings, whilst keeping your landscape healthy and beautiful. Add a Flow Meter, that is simple to install and set-up automatic notifications to alert you of broken pipes or sprinklers.

### Benefits of a Smart Water System:

- Consumption data available from any internet point 24/7. The data presented can be archived and compared, then put in graphic form and printed. Receive alarms for leaks, back-flow, battery issues or fraud, via email and SMS.
- Reduce leaks in the supply system within property boundaries.
- Quick and easy installation, no infrastructure needed.

### Second Water Meter:

- Having a second Water Meter installed means you may find you have cheaper water bills, as you can have more control of the water used to irrigate your garden.

*For further information please feel free to request a demonstration of the Water Meter device.*
